

# Patentex oval - the correct use

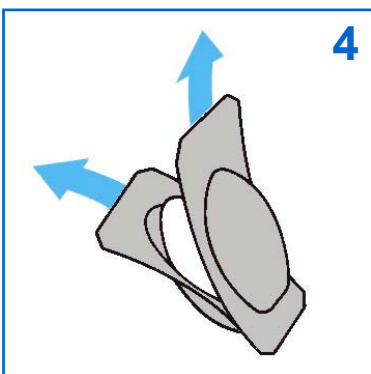

1 Insert the ovule finger-deep into the vagina at least 10 minutes before intercourse.

2 Wait for 10 minutes.

3 During these 10 minutes, the suppository dissolves completely into a microfine foam that spreads evenly within the vagina thus releasing the spermicidal active ingredient.

4 With each new intercourse, insert a new suppository. For safety reasons, use of another suppository is recommended if there has been no ejaculation within 1 hour, although the product is effective for up to 2 hours.
